The movie is great.

The movie stars Mr. X

The movie is horrible.

Recurrent Networks: Ontology Classification

Eva Ingolf is a well known Icelandic violinist particularly recognized for her authoritative performances of solo works by J. S. Bach. She comes from a leading musical family and her father Ingólfur Guðbrandsson premiered many of the great choral works in Iceland and six of her sisters and brothers are professional musicians who have made an important contribution to the high quality of the musical life in the country. Eva Ingolf currently lives in New York City with her husband Kristinn Sv.

Artist

Shaun Norris (born 14 May 1982) is a South African professional golfer. Norris plays on the Sunshine Tour where he has won twice. He won the inaugural Africa Open in 2008 and the Nashua Masters in 2011. He also began playing on the European Tour in 2011 after graduating from qualifying school.

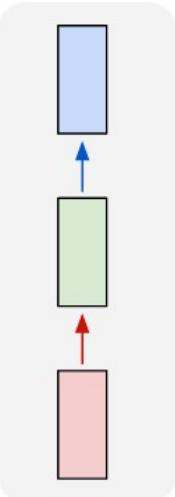

Athlete

Palace Software was a British video game publisher and developer during the 1980s based in London England. It was notable for the Barbarian and Cauldron series of games for 8-bit home computer platforms in particular the ZX Spectrum Amstrad CPC and Commodore 64.

Recurrent Networks: Problem Types

many to many

sequence to sequence

History of Recurrent Networks

- Dynamic Networks
 - can use current and previous inputs, in time
 - still popular, but simplified with discrete time steps
 - **been around for decades**

An Exercise: Strategy for Back-prop?

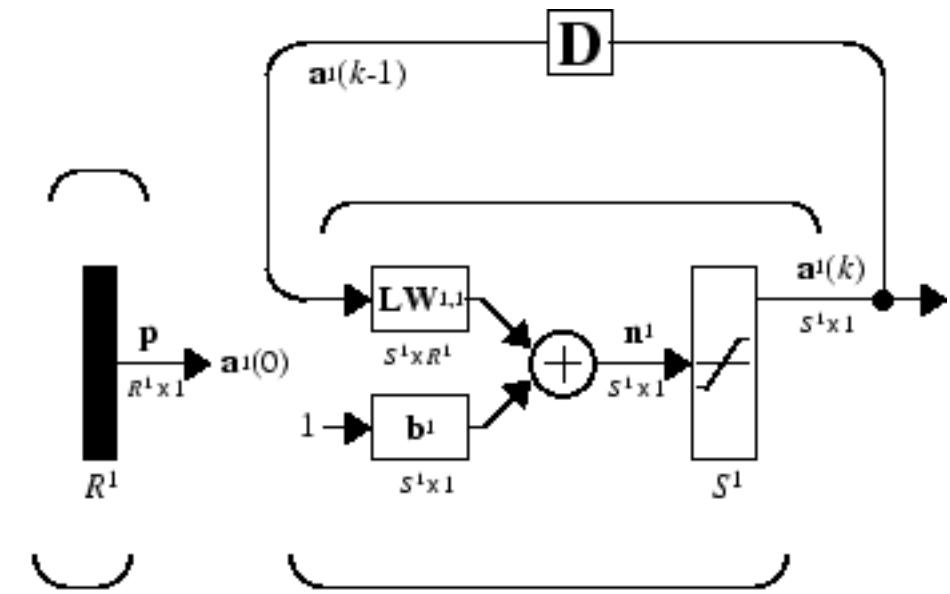

Neural Network Design, Hagan, Demuth, Beale, and De Jesus

History of Recurrent Networks

- Hopfield Network, 1982

John Hopfield, Princeton

Initial conditions

Symmetric saturated linear layer

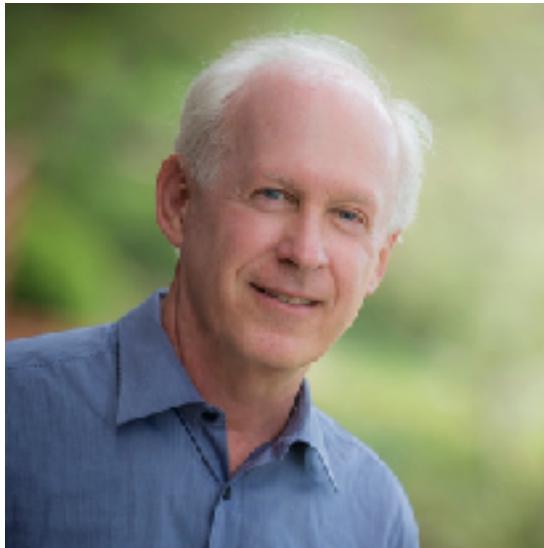

$\mathbf{a}^1(0) = \mathbf{p}$ and then for $k = 1, 2, \dots$

$\mathbf{a}^1(k) = \text{satlims}(\mathbf{LW}^{1,1}\mathbf{a}^1(k-1)) + \mathbf{b}^1$

Neural Network Design, Hagan, Demuth, Beale, and De Jesus

History of Recurrent Networks

- Elman/Jordan Networks, ~1988

Jeffrey Elman, UCSD

Michael Jordan, Berkeley

Elman network^[10]

$$h_t = \sigma_h(W_h x_t + U_h h_{t-1} + b_h)$$

$$y_t = \sigma_y(W_y h_t + b_y)$$

Jordan network^[11]

$$h_t = \sigma_h(W_h x_t + U_h y_{t-1} + b_h)$$

$$y_t = \sigma_y(W_y h_t + b_y)$$

Variables and functions

- x_t : input vector
- h_t : hidden layer vector
- y_t : output vector
- W , U and b : parameter matrices and vector
- σ_h and σ_y : Activation functions

Wikipedia

History of Recurrent Networks

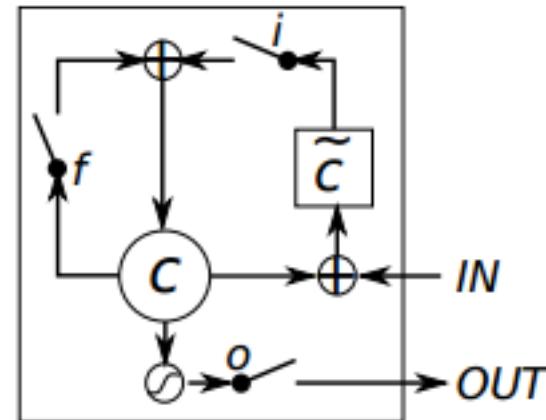

- Long Short Term Memory, ~1997 - 2010

Sepp Hochreiter, Many Universities

Jürgen Schmidhuber, Switzerland

More on these later

History of Recurrent Networks

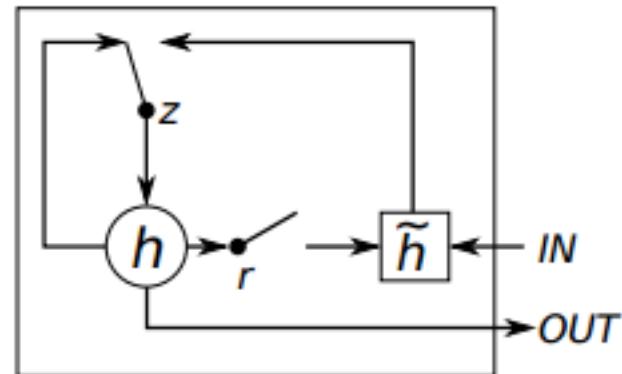

- Gated Recurrent Units, ~2014

Yoshua Bengio

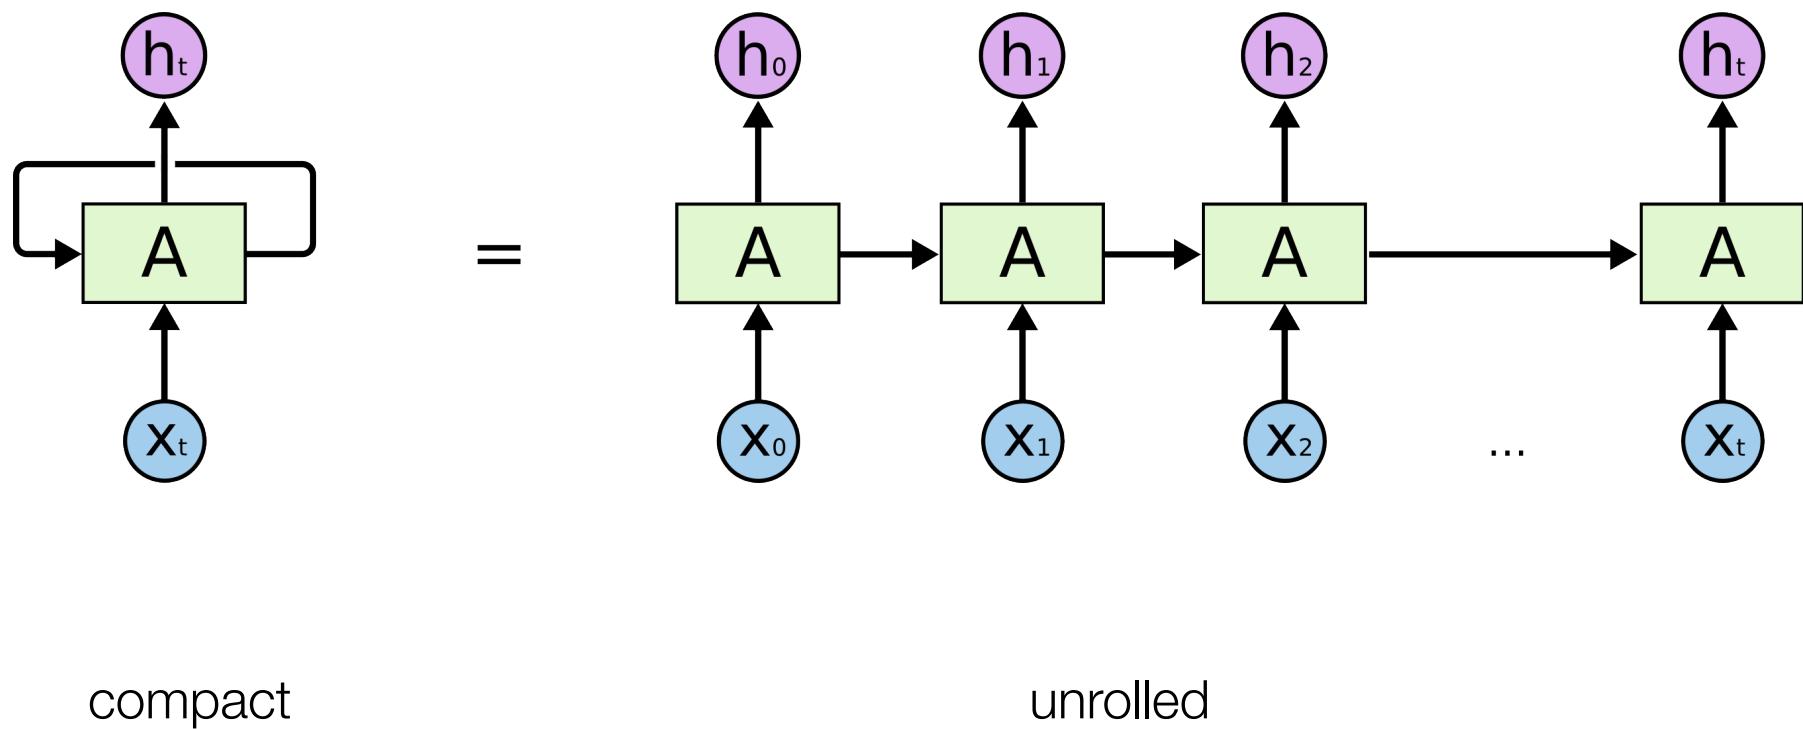

Kyunghyun Cho, Professor at NYU

Word Embeddings

Word Embeddings: Training

- many training options exist
 - a popular option, next word prediction

Word Embeddings • Many are pre-trained for you!!

GloVe

Global Vectors for Word Representation

Highlights

1. Nearest neighbors

The Euclidean distance (or cosine similarity) between two word vectors provides an effective method for measuring the linguistic or semantic similarity of the corresponding words. Sometimes, the nearest neighbors according to this metric reveal rare but relevant words that lie outside an average human's vocabulary. For example, here are the closest words to the target word *frog*:

- 0. *frog*
- 1. *frogs*
- 2. *toad*
- 3. *litoria*
- 4. *leptodactylidae*
- 5. *rana*
- 6. *lizard*
- 7. *eleutherodactylus*

3. *litoria*

4. *leptodactylidae*

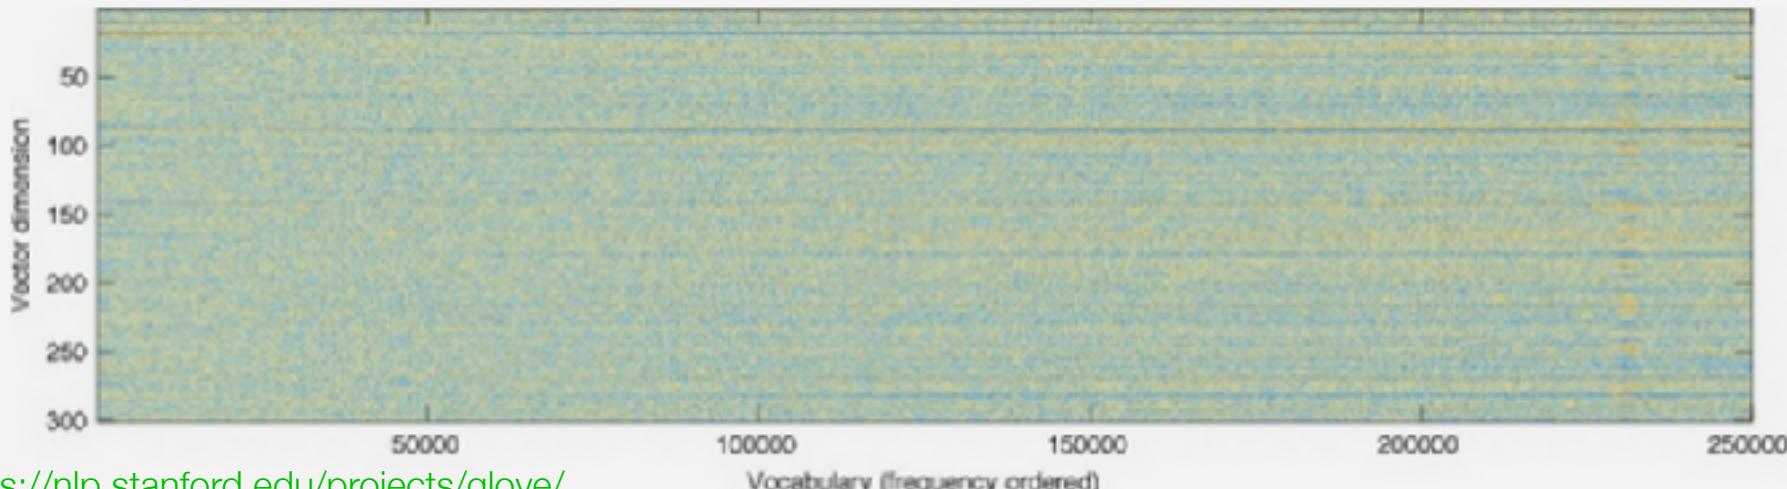

5. *rana*

7. *eleutherodactylus*

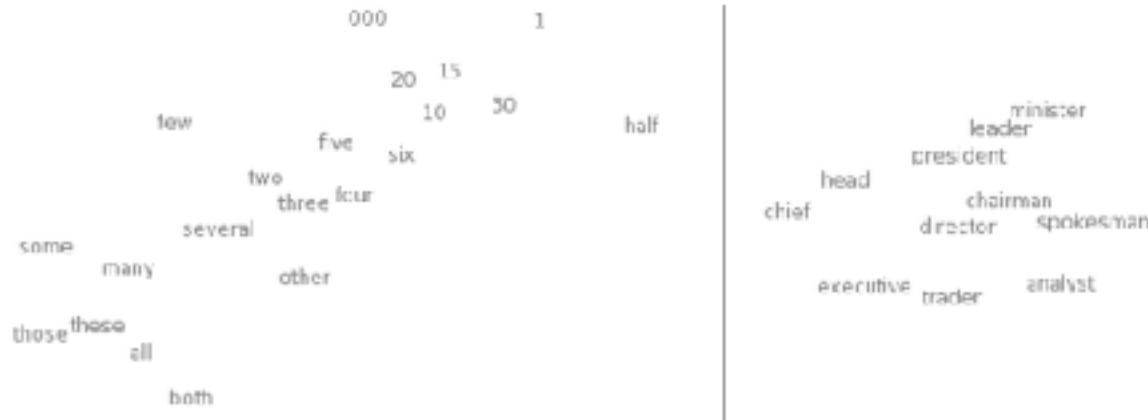

GloVe produces word vectors with a marked banded structure that is evident upon visualization:

Word Embeddings: proximity

GloVe

Global Vectors for Word Representation

t-SNE visualizations of word embeddings. Left: Number Region; Right: Jobs Region. From Turian *et al.* (2010), see complete image.

What words have embeddings closest to a given word? From Collobert
et al. (2011)

Word Embeddings: Analogy

GloVe

Global Vectors for Word Representation

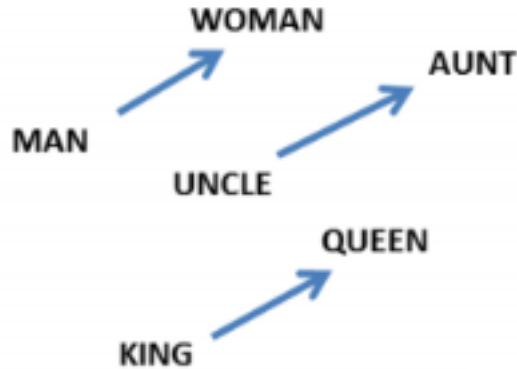

each axis might encode a different type of relationship

Word Embeddings: Analogy

GloVe

Global Vectors for Word Representation

$$W(\text{"woman"}) - W(\text{"man"}) \approx W(\text{"aunt"}) - W(\text{"uncle"})$$

$$W(\text{"woman"}) - W(\text{"man"}) \approx W(\text{"queen"}) - W(\text{"king"})$$

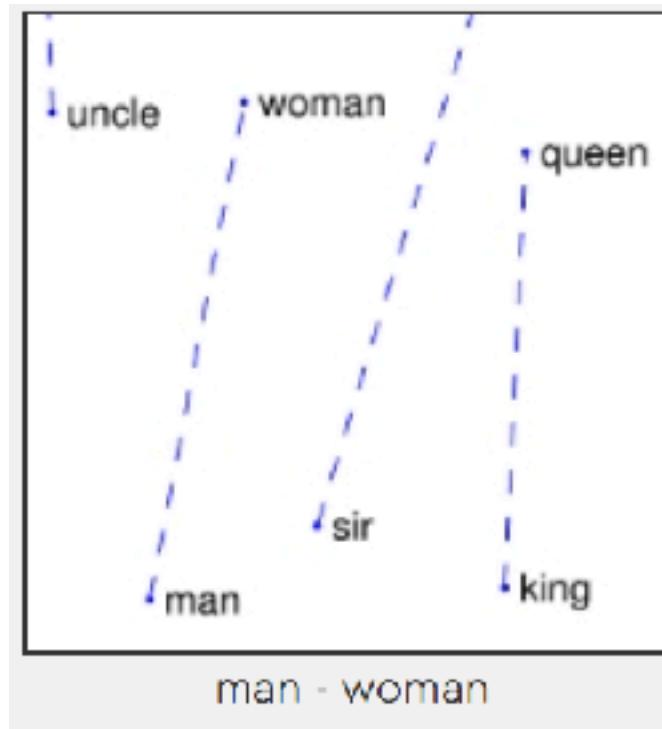

From Mikolov *et al.*
(2013a)

Relationship	Example 1	Example 2	Example 3
France - Paris	Italy: Rome	Japan: Tokyo	Florida: Tallahassee
big - bigger	small: larger	cold: colder	quick: quicker
Miami - Florida	Baltimore: Maryland	Dallas: Texas	Kona: Hawaii
Einstein - scientist	Messi: midfielder	Mozart: violinist	Picasso: painter
Sarkozy - France	Berlusconi: Italy	Merkel: Germany	Koizumi: Japan
copper - Cu	zinc: Zn	gold: Au	uranium: plutonium
Berlusconi - Silvio	Sarkozy: Nicolas	Putin: Medvedev	Obama: Barack
Microsoft - Windows	Google: Android	IBM: Linux	Apple: iPhone
Microsoft - Ballmer	Google: Yahoo	IBM: McNealy	Apple: Jobs
Japan - sushi	Germany: bratwurst	France: tapas	USA: pizza

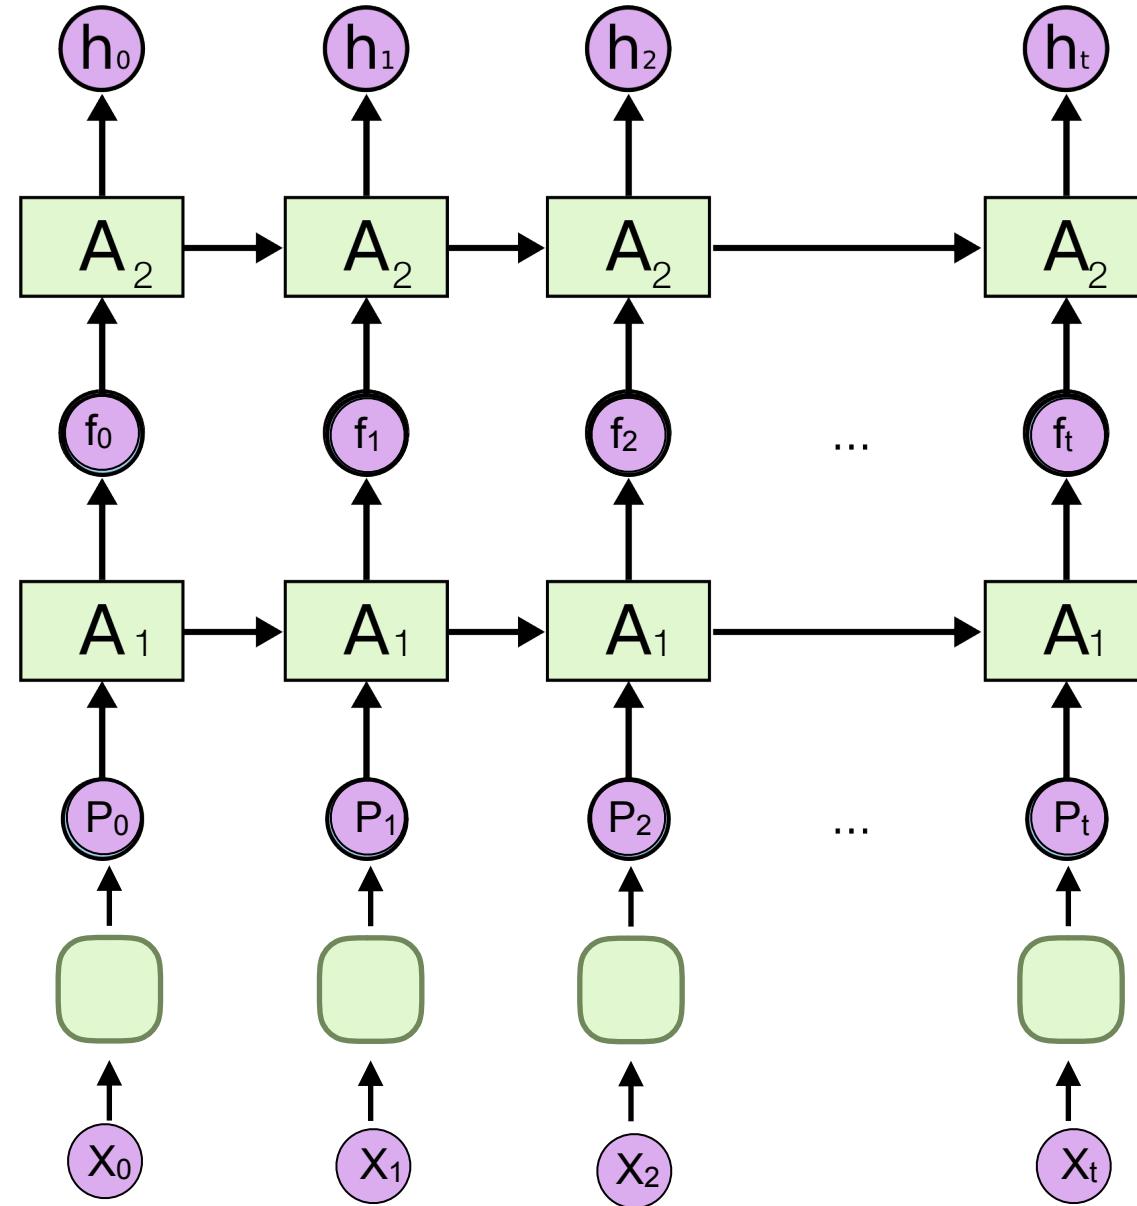

Relationship pairs in a word embedding. From Mikolov *et al.* (2013b).

Self Test: Analogy

- Each axis on the embedding plot below corresponds to:
 - a weight inside the embedding layer
 - the average of weights inside the embedding layer
 - the average of the one hot encoding for a word
 - an output of the embedding layer

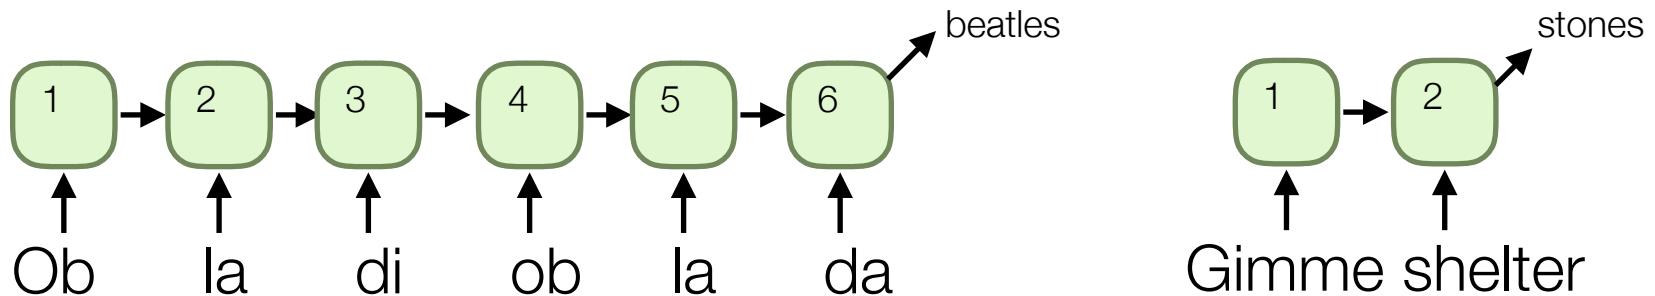

Sequence Stacking

keras:
return sequences

Practical Logistics: Sequence Length

- option A: dynamic length sequences

- option B: padding/clipping

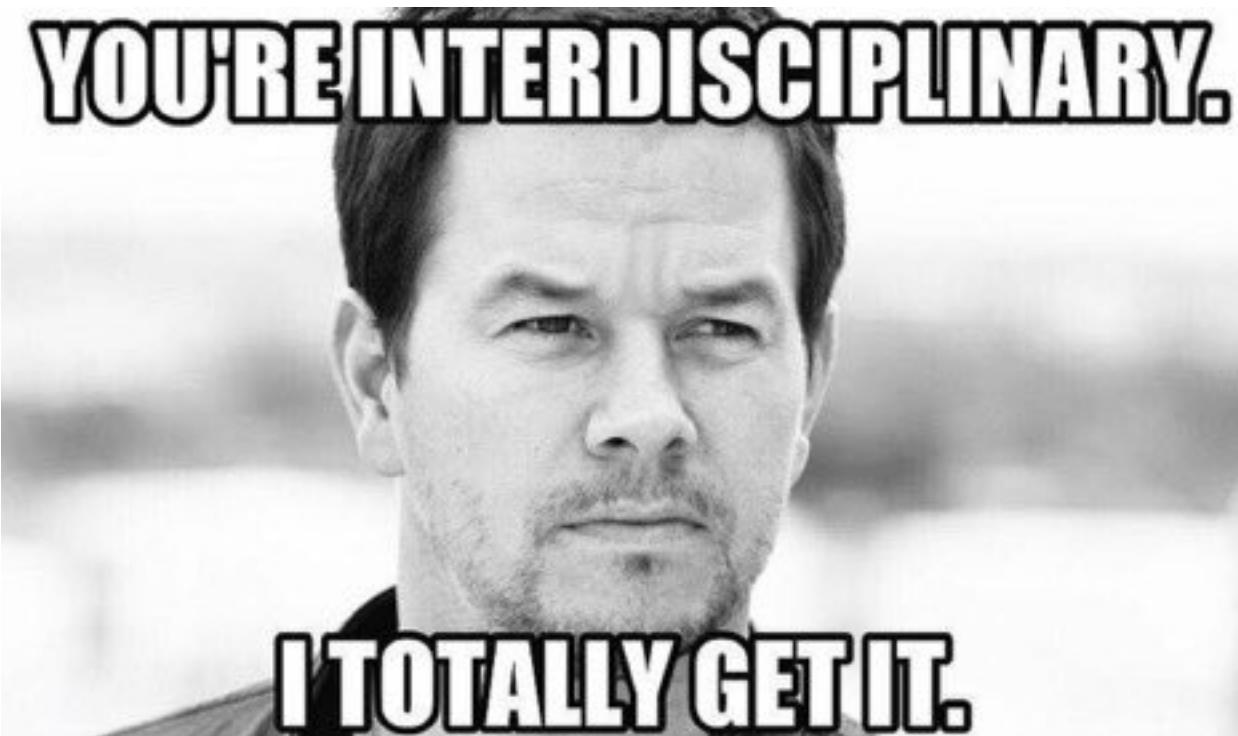

- main difference:

speed based on computation graph design

Self Test

- The main reason dynamic length is slow is because:
 - A. the computation graph must be updated
 - B. weights must be tied together for each recurrent node
 - C. the weights must be multiplied until the output converges
 - D. the unrolling operation takes some time

Recurrent Generation

Generating More Outputs

- Highly sophisticated steps:
 - train an RNN to generate the **next** word/character from the **current** word/character
 - train on a corpus of text
 - Shakespeare
 - Movie Scripts
 - Whatever!
 - seed with random word,
feed output words as input to next node
 - rinse, repeat

Recurrent Networks: Character Data

First Citizen:

Before we proceed any further, hear me speak.

All:

Speak, speak.

First Citizen:

You are all resolved rather to die than to famish?

All:

Resolved. resolved.

First Citizen:

First, you know Caius Marcius is chief enemy to the people.

All:

We know't, we know't.

First Citizen:

Let us kill him, and we'll have corn at our own price.

Is't a verdict?

All:

No more talking on't; let it be done: away, away!

Second Citizen:

One word, good citizens.

ervices he has done for his country?

First Citizen:

ANNALEE NEWITZ - 6/9/2016, 5:30 AM

Back to Reality: Types of RNNs

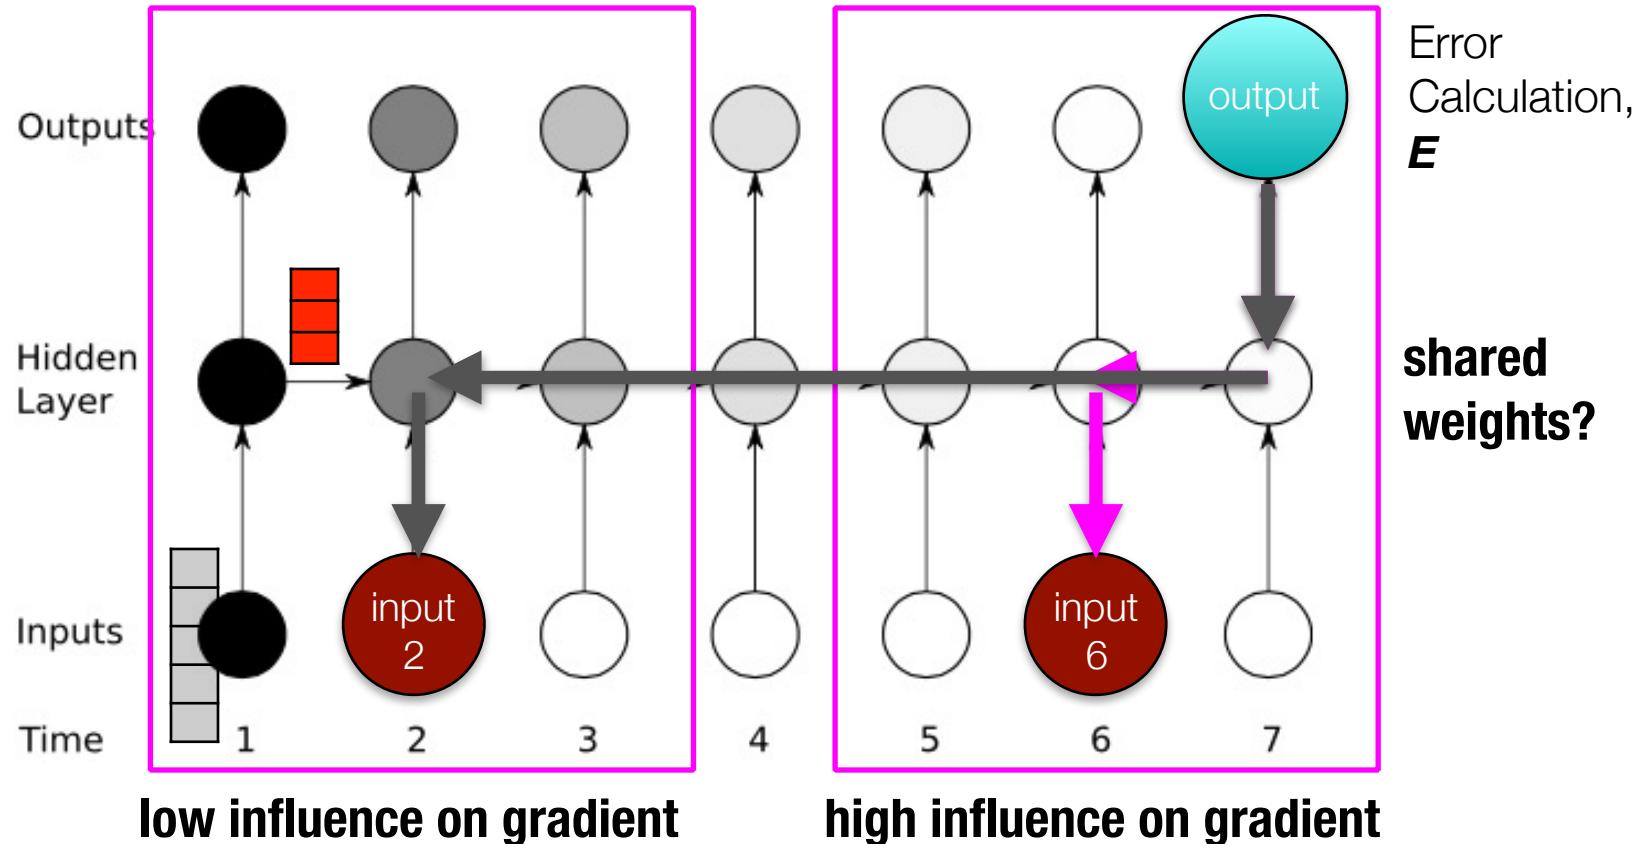

General recurrent flow (many to one)

Recurrent Networks, the Age Old Problem

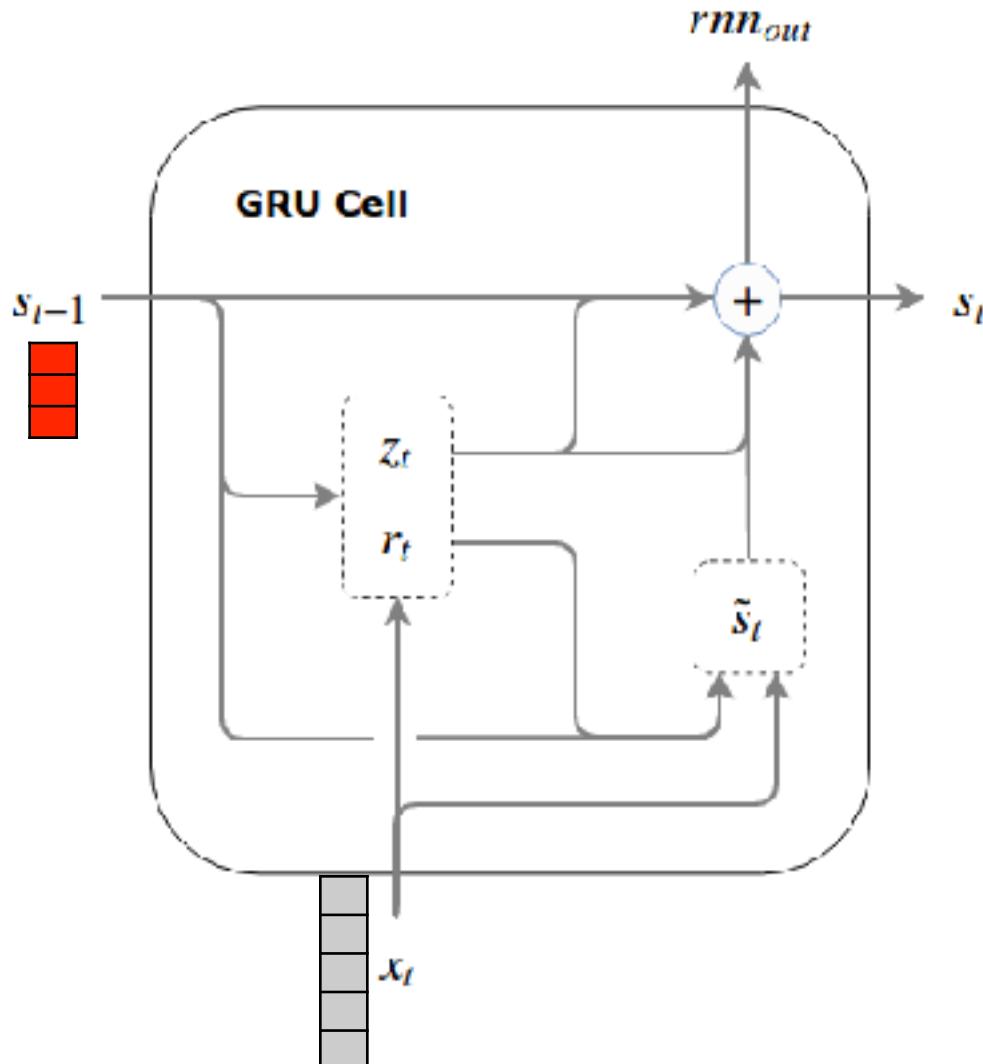

- vanishing gradients: is this the same?

$$\frac{\partial E_t}{\partial S_{t-k}} = \frac{\partial E_t}{\partial S_t} \frac{\partial S_t}{\partial S_{t-k}} = \frac{\partial E_t}{\partial S_t} \left(\frac{\partial S_t}{\partial S_{t-1}} \frac{\partial S_{t-1}}{\partial S_{t-2}} \dots \frac{\partial S_{t-k+1}}{\partial S_{t-k}} \right) = \frac{\partial E_t}{\partial S_t} \prod_{i=1}^k \frac{\partial S_{t-i+1}}{\partial S_{t-i}}$$

Recurrent Networks: GRUs

- gated recurrent units

Selectivity controls, gates (**0 or 1**)

$$r_t = \sigma(W_r s_{t-1} + U_r x_t + b_r)$$
$$z_t = \sigma(W_z s_{t-1} + U_z x_t + b_z)$$

past state

current input

selectively remember

with influence

$$\tilde{s}_t = \phi(W(r_t \odot s_{t-1}) + U x_t + b)$$

$$s_t = z_t \odot s_{t-1} + (1 - z_t) \odot \tilde{s}_t$$

remember only past

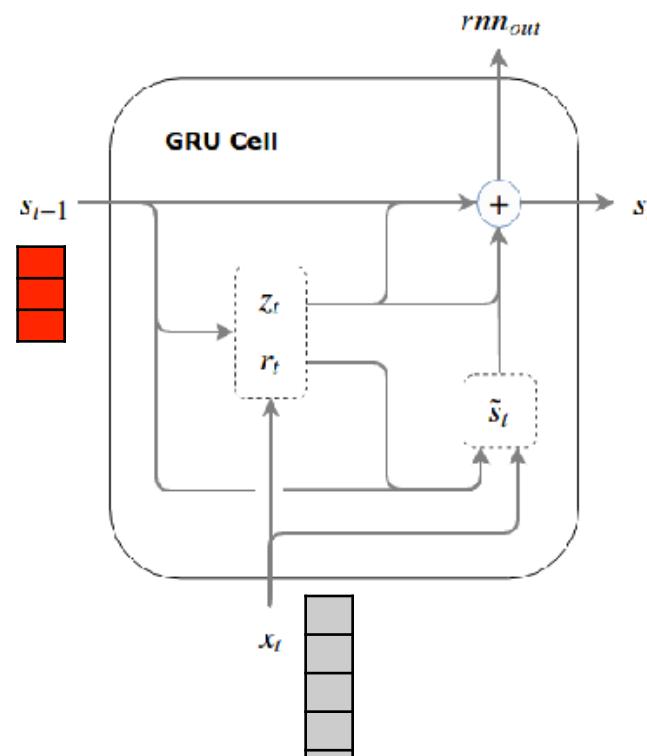

OR remember with input

σ = hard limit

\odot = elem. multiplication

Self Test

- What element of the GRU helps with vanishing and exploding gradients?
- A. derivative of ϕ
- B. derivative of σ
- C. σ
- D. ϕ

$$r_t = \sigma(W_r s_{t-1} + U_r x_t + b_r)$$

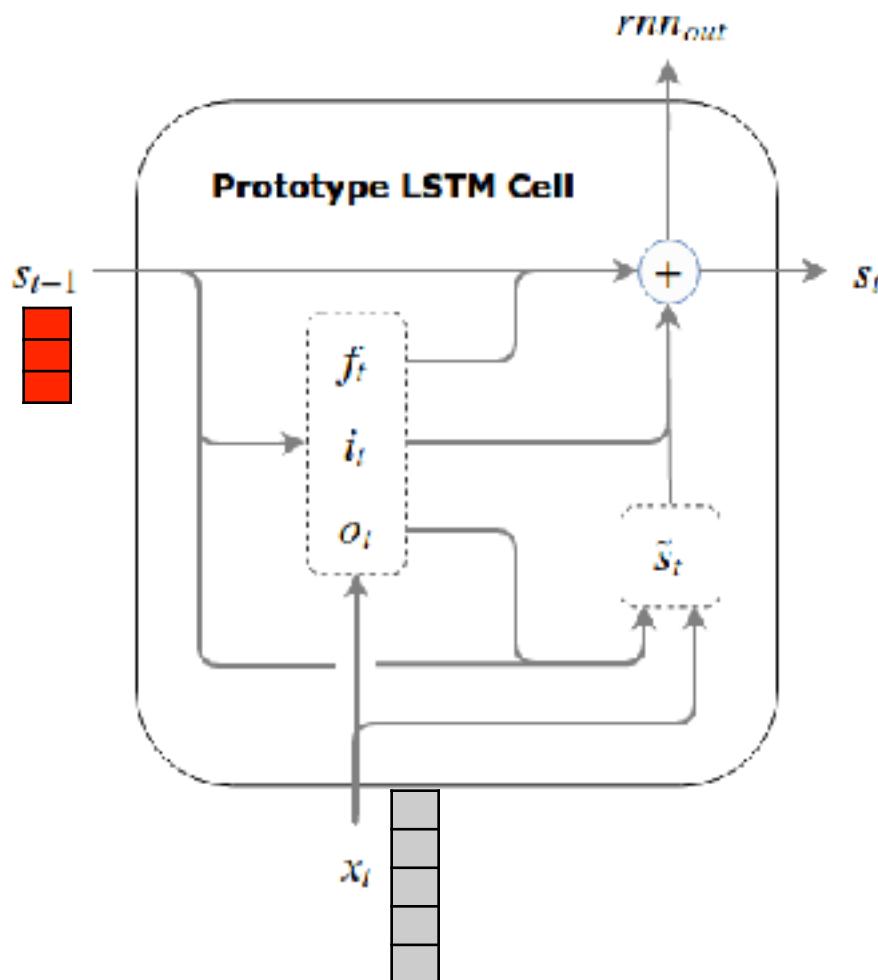

$$z_t = \sigma(W_z s_{t-1} + U_z x_t + b_z)$$

$$\tilde{s}_t = \phi(W(r_t \odot s_{t-1}) + Ux_t + b)$$

$$s_t = z_t \odot s_{t-1} + (1 - z_t) \odot \tilde{s}_t$$

Recurrent Networks: Gen 1 LSTM

- LSTM prototype

Selectivity controls (**gates, 0 or 1**)

$$o_t = \sigma(W_o s_{t-1} + U_o x_t + b_o)$$

$$i_t = \sigma(W_i s_{t-1} + U_i x_t + b_i)$$

$$f_t = \sigma(W_f s_{t-1} + U_f x_t + b_f)$$

selectively remember past with influence

$$\tilde{s}_t = \phi(W(o_t \odot s_{t-1}) + Ux_t + b)$$

$$s_t = f_t \odot s_{t-1} + i_t \odot \tilde{s}_t$$

selectively remember past

with past weighted influence

What to choose?

- There is no hard and fast rule
 - try both
 - basic LSTM has had great success
 - GRU also sometimes is easier to train
 - you will see many variations
 - peephole LSTM
 - hierarchical LSTM
 - and many more...

Visualization

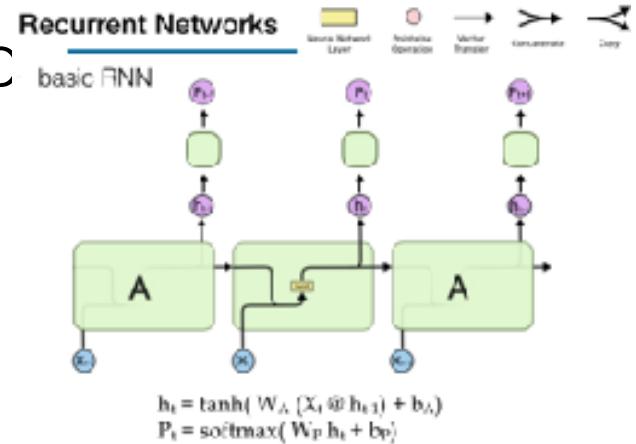

GloVe produces word vectors with a marked banded structure that is evident upon visualization:

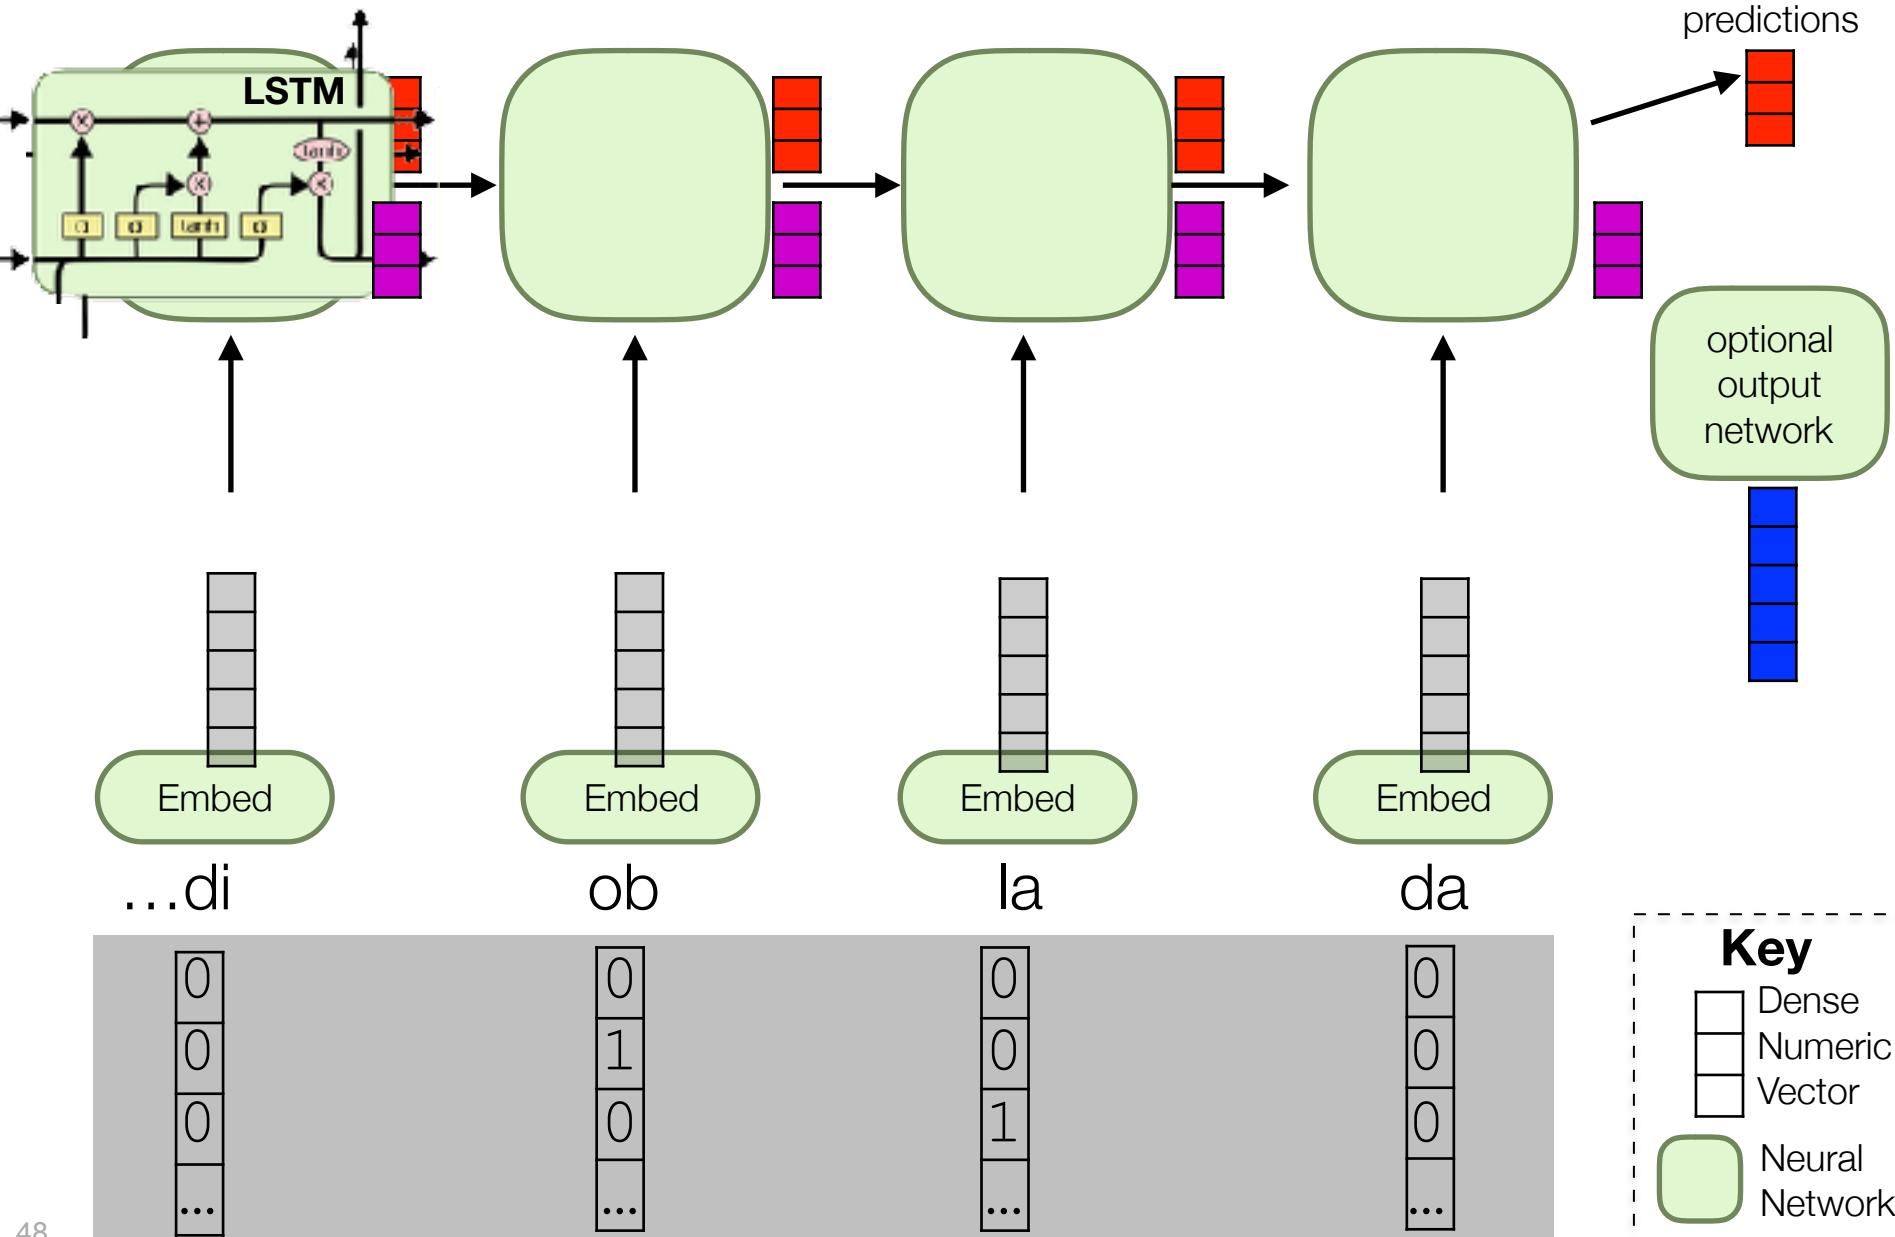

<http://colah.github.io/posts/2015-03-Understanding-LSTMs/>

Self Test

- T/F: In Recurrent Neural Networks that are “rolled out”, each RNN cell can be run in parallel.
 - A. **True**, state vectors can be added later
 - B. **True**, but parallelization must use forward backward (like Viterbi)
 - C. **False**, state vectors must be found sequentially
 - D. **False**, input changes due to sequential nature of X_t

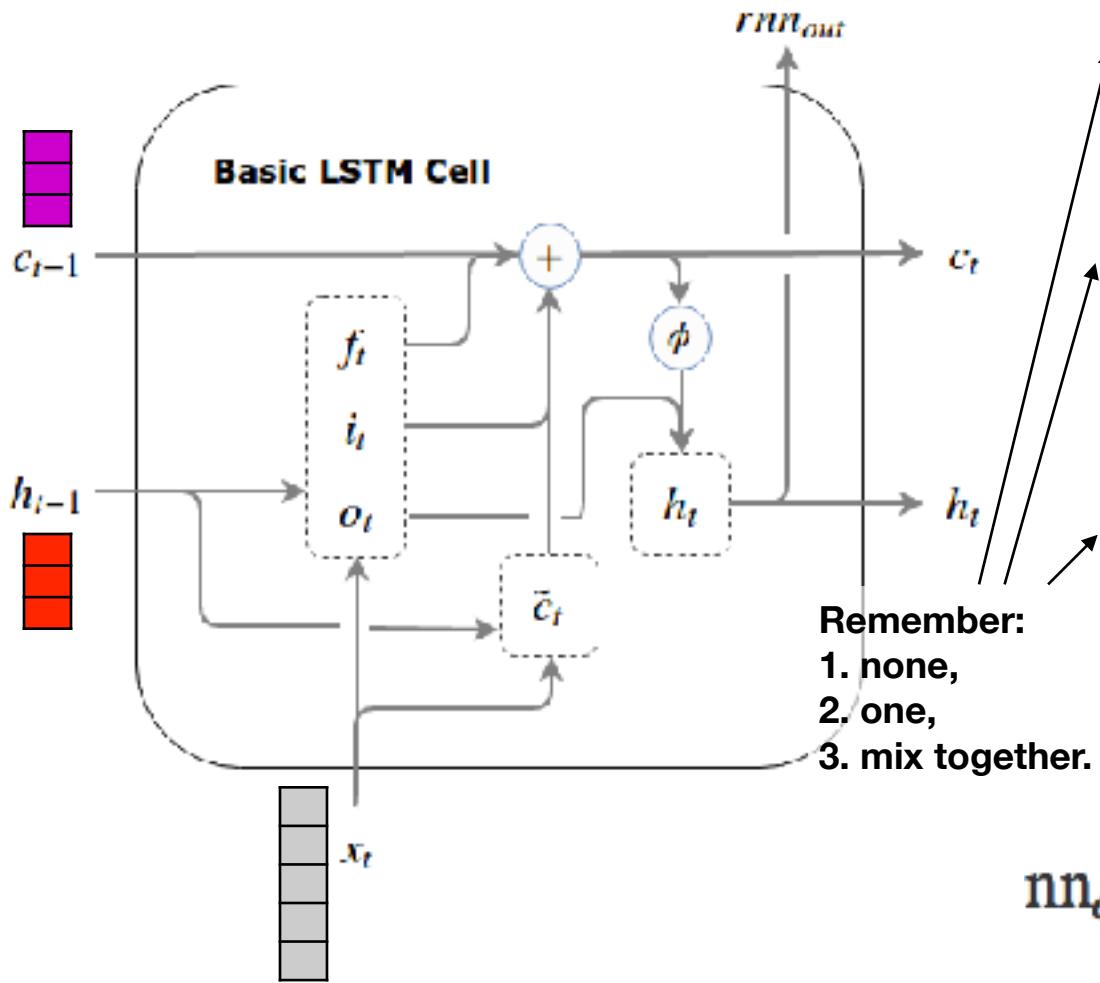

General recurrent flow (many to one)

Recurrent Networks: Gen 2 LSTM

- LSTM in TensorFlow

Selectivity controls

$$i_t = \sigma(W_i h_{t-1} + U_i x_t + b_i)$$

$$o_t = \sigma(W_o h_{t-1} + U_o x_t + b_o)$$

$$f_t = \sigma(W_f h_{t-1} + U_f x_t + b_f)$$

explicit remembering state

$$\tilde{c}_t = \phi(Wh_{t-1} + Ux_t + b)$$

$$c_t = f_t \odot c_{t-1} + i_t \odot \tilde{c}_t$$

remember
previous state

update with
output, h_t

$$h_t = o_t \odot \phi(c_t)$$

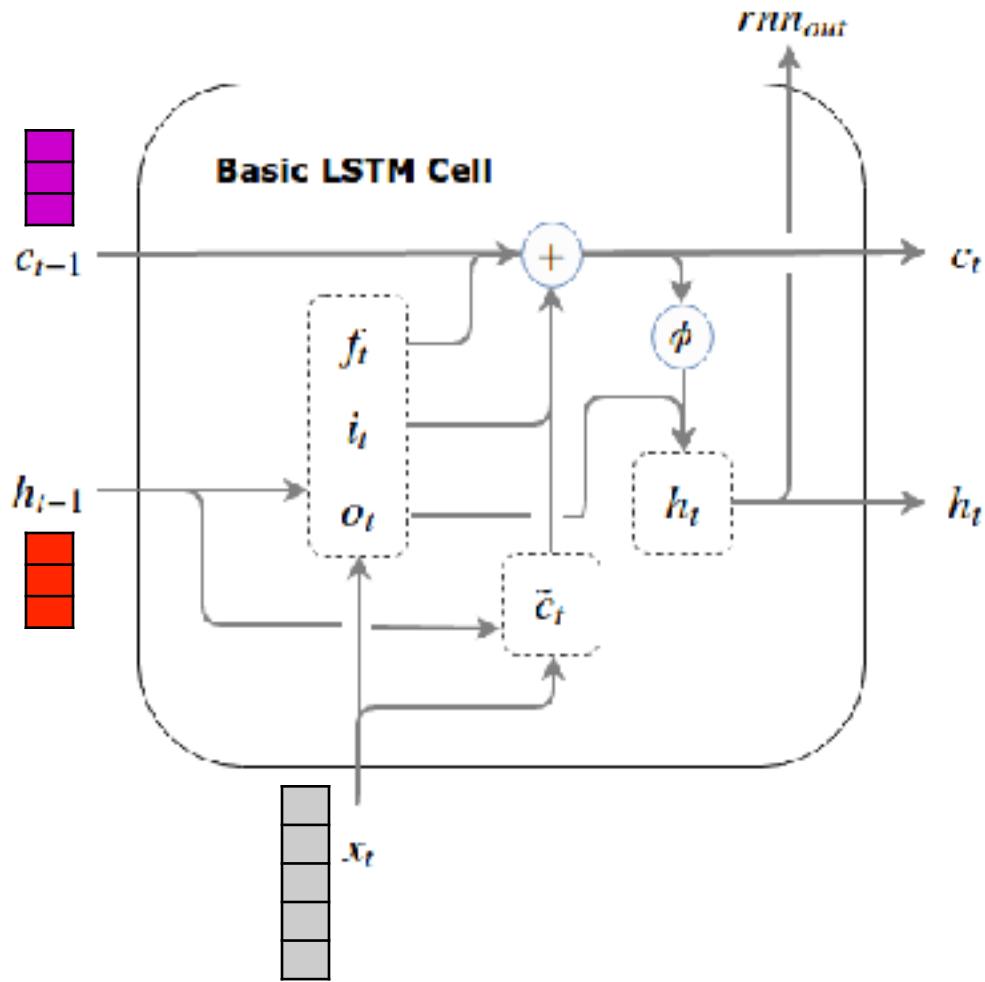

get output from current state

$$nn_{out} = h_t$$

Mix output with State

LSTM Dropout

- LSTM in TensorFlow

$$i_t = \sigma(W_i h_{t-1} + U_i x_t + b_i)$$
$$o_t = \sigma(W_o h_{t-1} + U_o x_t + b_o)$$
$$f_t = \sigma(W_f h_{t-1} + U_f x_t + b_f)$$

 Subject: Letter of resignation from Machine Learning journal*

Dear colleagues in machine learning,

The forty people whose names appear below have resigned from the Editorial Board of the Machine Learning Journal (MLJ). We would like to make our resignations public, to explain the rationale for our action, and to indicate some of the implications that we see for members of the machine learning community worldwide.

The machine learning community has come of age during a period of enormous change in the way that research publications are circulated. Fifteen years ago research papers did not circulate easily, and as with other research communities we were fortunate that a viable commercial publishing model was in place so that the fledgling MLJ could begin to circulate. The needs of the community, principally those of seeing our published papers circulate as widely and rapidly as possible, and the business model of commercial publishers were in harmony.

Times have changed. Articles now circulate easily via the Internet, but unfortunately MLJ publications are under restricted access. Universities and research centers can pay a yearly fee of \$1050 US to obtain unrestricted access to MLJ articles (and individuals can pay \$120 US). While these fees provide income for institutions and individuals who can afford them, we feel that they also have the effect of limiting contact between the current machine learning community and the potentially much larger community of researchers worldwide whose participation in our field should be the fruit of the modern Internet.

None of the revenue stream from the journal makes its way back to authors, and in this context authors should expect a particularly favorable return on their intellectual contribution---they should expect a service that maximizes the distribution of their work. We see little benefit accruing to our community from a mechanism that ensures revenue for a third party by restricting the communication channel between authors and readers.

Syllabus for CSE8321: Machine Learning and Neural Networks

Overview

This course extends basic knowledge of the use of Neural Networks in machine learning beyond simple prediction, especially targeted outputs that are generation or alteration of images, text, and audio. This course emphasizes topics of neural networks in the “deep learning” subdomain. This course will survey of important topics and current areas of research, including transfer learning, multi-task and multi-modal learning, image-style transfer, neural network visualization, deep convolutional generative adversarial networks, and deep reinforcement learning. For grading, students are expected to complete smaller team-based projects throughout the semester, present one research paper in a 15-20 minute group presentation (covering topics in the course), and complete a comprehensive final project that involves a number of different deep learning architectures.

Thank you for a great semester!

- but it could **have been better** somehow, right?
 - if you went into a job interview for a data scientist position and were asked about **X**, that you did not feel strong in, what would **X** be?
 - *i.e.*, what didn't translate well?
 - *i.e.*, what are you **still not comfortable** with?
 - how could you learn better? same datasets to compare with others?
 - what should **not be cut** or **changed**?
 - what **skills** should students have **before this class** that I don't yet require?
 - covered by undergraduate ML course?

Thank You for an Excellent Semester!

More Advanced Architectures

- **LSTM key idea:** limit how past data can affect output

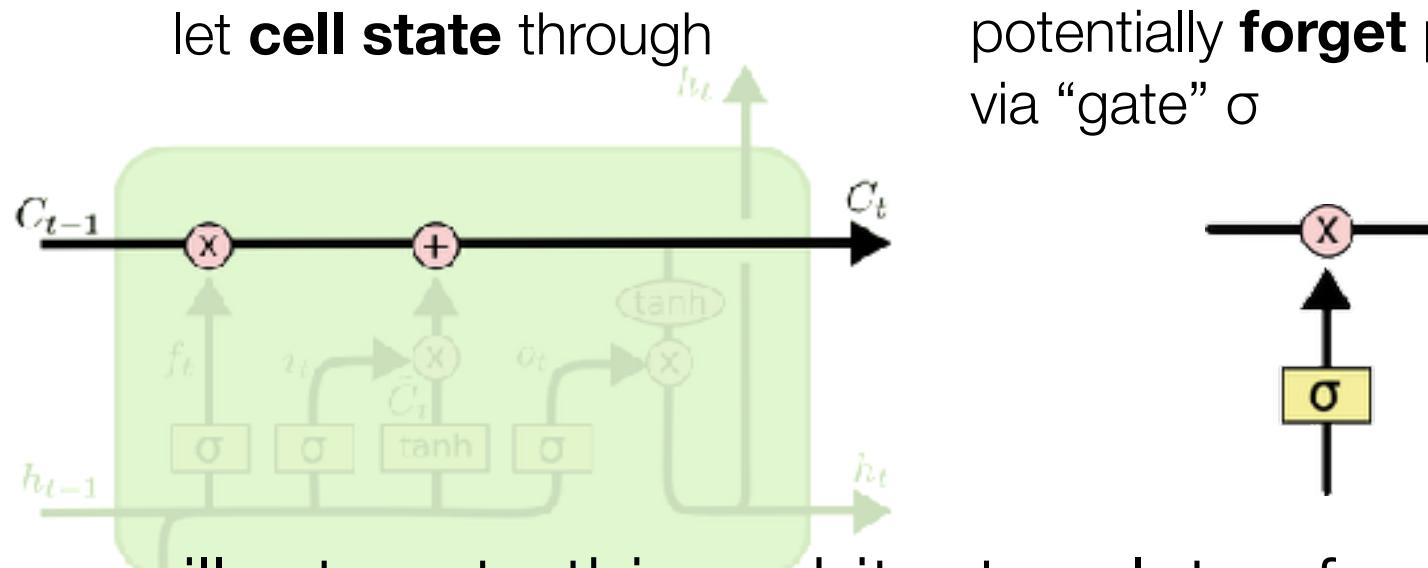

More Advanced Architectures

- **LSTM key idea:** limit how past data can affect output

More Advanced Architectures

- **LSTM key idea:** limit how past data can affect output

we will return to this architecture later, for now:
put it in long term memory 😂
